A Message from the Mermaid and the FrostbitFins Pod!

Hello, FeatherFins!

It's February - and even though I am an Arctic Mermaid, I'm happy to see the weather warming up - January was COLD!

We did have some warm moments though; a brief visit with Kimber for her birthday, and a party in Anchorage with Addie this past weekend. We may not be doing vendor shows right now, but we are available for parties and appearances year round. Have a special occasion and need a Splash of Magic? Give us a call!

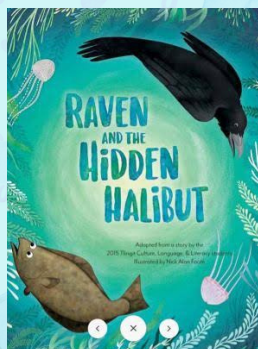

Meanwhile, Happy Valentine's Day to all of our FeatherFins! We love you all!

Sincerely,
AnneMeridia & the FbF Pod

UPCOMING EVENTS:

We are taking a vendor show break ~ but you can always shop the store with free local pickups available! Also - don't forget to follow us on all socials to see what we're up to next. We will be back with our booth in May for the Seward Mermaid Festival!

Raven and the Hidden Halibut

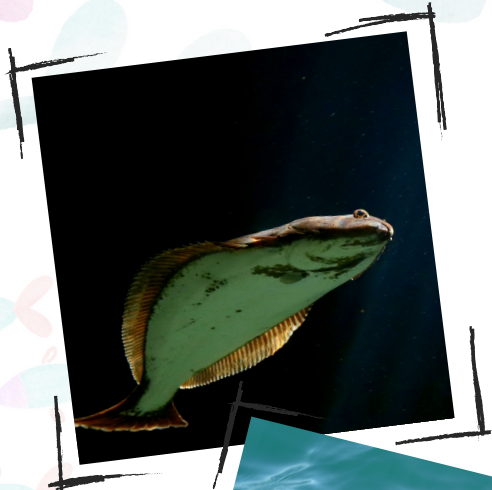

Adapted from a story by the 2015 Tlingit Culture, Language, and Literacy students

Halibut wants to play. He spots Raven and invites him to a game of hide and seek. Raven is surprised how well Halibut, a bright white fish, can hide! Raven recruits many friends to join the search. Where could Halibut be?

* February Fin Facts *

Halibut!

- There are three types of halibut- the Atlantic halibut, the Pacific halibut, and the Greenland halibut.
- There are a number of flounder that are often called halibut, but they are not true halibut.
- Halibut swim in the waters of the northern Atlantic, northern Pacific, and Arctic oceans.
- At birth halibut are symmetrical, with one eye on each side of its head. At six months old one eye will migrate to the other side. While its eye moves, leaving them both on one side, its mouth remains in the same position.
- Nearly all halibut are right-eyed, meaning both eyes are on the right side of the fish. Only 1 in 20,000 are left-eyed.
- Because halibut are flattened laterally, they swim sideways- one side facing up and one side facing down.
- The bottom side of the halibut is an off white color. The upper side is a gray to brown color that is mottled and spotted. This spotty appearance allows it to blend in with the ocean bottom, camouflaging it from the few predators it has.
- Halibut live at depths of a few meters to a few hundred meters. Although they spend most of their time near the bottom of the ocean, they move up the water column to feed.
- The oldest known halibut was documented as being 55 years old. Its age was estimated by counting the rings in the otolith, or ear bones.
- Halibut can grow to over 8 feet long and over 500 pounds!
- Large halibut are nicknamed barndoors. Small halibuts are called chickens.

🐟 Fin Funnies! 🐟

Why are halibut so easy to weigh?
Because they have their own scales!

Why did the halibut blush?
Because it saw the ocean's bottom!

Where do halibut's sleep?
In water beds!
